- Goal: **Optimization of model parameters**
- Models of technical system = Physical properties + Control properties

## Problem Setting

```
[ label = AA, width = 80mm, height = 50mm, activate = pageopen,  
addresource= videos/ArmMovement.mp4,  
flashvars=flv=videos/ArmMovement.mp4 autoplay=1 loop=1  
]playerflv_maxi.swf
```

# Procedure

## Physical Model

- Rope properties
- Lagrange Formalism

## Parameter Identification

Discretization + Optimization

# Procedure

## Physical Model

- Rope properties
- Lagrange Formalism

## Parameter Identification

Discretization + Optimization

and

## Blackbox Model

- Realistic model
- Confidential information

## Parameter Identification

Derivative-free optimization

# Physical Modeling

## Why?

Building an  
accurate model

Good description of  
the effects of control  
on motion

# Physical Modeling

## How?

To consider:

- Friction in cable reels
- Potential/Kinetic energy
- etc

# Physical Modeling

## How?

To consider:

- Friction in cable reels
- Potential/Kinetic energy
- etc

Lagrange Formalism  
(ODE)

# Parameter Identification

## What are parameters?

- Friction coefficients
- Mass
- Inertia

# Parameter Identification

## What are parameters?

- Friction coefficients
- Mass
- Inertia

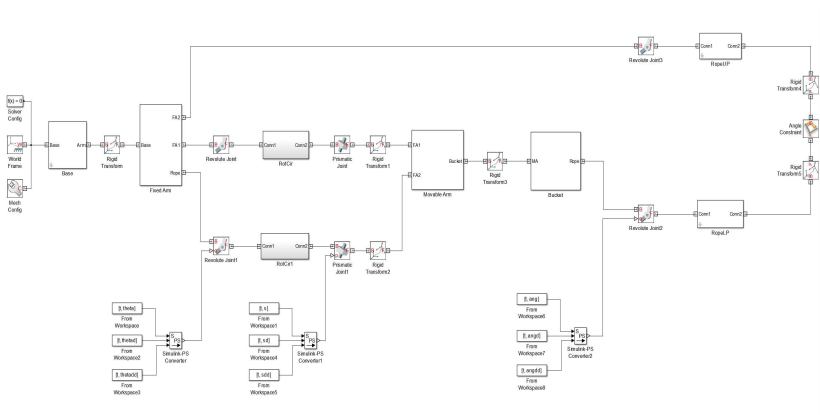

## Why?

Accurate and  
realistic parameters

Better prediction  
and planning of  
motion

# Visualization: Simulink

## Visualization Example

Same parameters except different load weights

[ label = BB, width = 50mm,  
height = 50mm, activate =  
pageopen, addresource=  
videos/traj<sub>x0</sub>95p.mp4, flashvars =  
flv = videos/traj<sub>x0</sub>95p.mp4autoplay = 1

**vs**

[ label = CC, width = 50mm,  
height = 50mm, activate =  
pageopen, addresource=  
videos/traj<sub>x1</sub>05p.mp4, flashvars =  
flv = videos/traj<sub>x1</sub>05p.mp4autoplay = 1

# Lagrange Formalism

Method to describe dynamics of an accelerated system

# Lagrange Formalism

Method to describe dynamics of an accelerated system

T   kinetic energy  
V   potentials

# Lagrange Formalism

Method to describe dynamics of an accelerated system

T kinetic energy

V potentials

F non-conservative external forces

# Lagrange Formalism

Method to describe dynamics of an accelerated system

$T$	kinetic energy
$V$	potentials
$F$	non-conservative external forces
$r$	points of actions of forces $F$
$q$	free variables
$Q$	generalized forces

# Lagrange Formalism

Method to describe dynamics of an accelerated system

$$\frac{d}{dt} \left( \frac{\partial T}{\partial \dot{q}_i} \right) - \frac{\partial T}{\partial q_i} + \frac{\partial V}{\partial q_i} = Q_i$$

$$Q = \left( \frac{\partial r}{\partial q} \right)^T F$$

T kinetic energy

V potentials

F non-conservative external forces

r points of actions of forces F

q free variables

Q generalized forces

# Physical Model of Excavator

# Physical Model of Excavator

degrees of freedom

- length  $s$
- tilt angle  $\theta$

# Kinetic Energy

- movement of mass
- rotation of cable reel

# Potential Energy

gravitational potential energy

# Potential Energy

gravitational potential energy

$$\frac{d}{dt} \left( \frac{\partial T}{\partial \dot{q}_i} \right) - \frac{\partial T}{\partial q_i} + \frac{\partial V}{\partial q_i} = Q_i$$

$$Q = \left( \frac{\partial r}{\partial q} \right)^T F$$

# Generalized Forces

- torque on cable reels
- friction of cable reels

# Lagrange Formalism

$$\frac{d}{dt} \left( \frac{\partial T}{\partial \dot{s}} \right) - \frac{\partial T}{\partial s} + \frac{\partial V}{\partial s} = Q_s$$

$$\frac{d}{dt} \left( \frac{\partial T}{\partial \dot{\theta}} \right) - \frac{\partial T}{\partial \theta} + \frac{\partial V}{\partial \theta} = Q_\theta$$

# Resulting ODE

$$A(x, p) \begin{pmatrix} \ddot{s} \\ \ddot{\theta} \end{pmatrix} = b(x, u, p)$$

## Resulting ODE

$$A(x, p) \begin{pmatrix} \ddot{s} \\ \ddot{\theta} \end{pmatrix} = b(x, u, p)$$

→ Transformation into 1st order ODE

$$\frac{d}{dt} \begin{pmatrix} s \\ \theta \\ \dot{s} \\ \dot{\theta} \end{pmatrix} = \begin{pmatrix} \dot{s} \\ \dot{\theta} \\ A^{-1}(x, p)b(x, u, p) \end{pmatrix} = f(x, u, p)$$

state	$x = (s, \theta, \dot{s}, \dot{\theta})^T$
control	$u = (\tau_1, \tau_2)^T$
parameters	$p = (p_1, \dots, p_k)^T$

# Table of Contents

- 1 Project Overview
- 2 Physical Model
- 3 Parameter Identification: Physical Model**
- 4 Parameter Identification: Black Box Model
- 5 Summary

# Discretization of the ODE

Discretize time interval:

$$[0, T] \rightarrow \{0 = t_0, t_1, \dots, t_{m-1}, t_m = T\}$$

Discretize state and control:

$$x_n = x(t_n)$$

$$u_n = u(t_n)$$

# Discretization of the ODE

Explicit Euler for every time step  $h_n = t_{n+1} - t_n$ :

$$\Psi(x_n, u_n, p) = x_n + h_n f(x_n, u_n, p)$$

Discrete constraint:

$$0 = x_{n+1} - \Psi(x_n, u_n, p) =: \Phi_n(x, u, p) \quad \forall n = 0, \dots, m-1$$

# Discretization of the ODE

# Problem Setting

Given:

- control  $\bar{u}$
- motion  $\bar{x}$  related to  $\bar{u}$  and  $\bar{p}$

Unknown:

- parameters  $\bar{p}$  of the excavator

Output:

- parameters  $p$

[ label = DD, width = 50mm,  
height = 50mm, activate =  
pageopen, addresource=  
videos/traj<sub>xx</sub>ref3.mp4, flashvars =  
flv = videos/traj<sub>xx</sub>ref3.mp4auto

# Possible Approaches

continuous vs. stepwise Approximation

# Problem Formulation

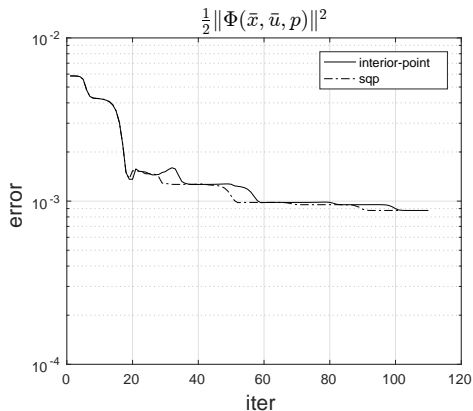

$$\begin{array}{ll} \min_p & \frac{1}{2} \|\Phi(\bar{x}, \bar{u}, p)\|^2 \\ \text{s. t.} & p \geq 0 \end{array}$$

- $\bar{x}$  solves ODE for  $\bar{u}, \bar{p}$
- $\Phi(\bar{x}, \bar{u}, \bar{p}) \rightarrow 0$  for discretization  $m \rightarrow \infty$
- number of parameters fix

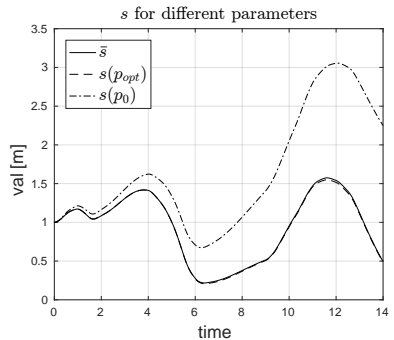

# Example Instance

- $[0, T] = [0, 14s]$
- 1500 time steps
- $p_0 \in [0.8\bar{p}, 1.2\bar{p}]$
- internally 5 trajectories in parallel

# Results

# Results

In total exact up to 3cm

# Objective Function

## Optimized Parameters:

- Inertia (Engine)
- Inertia (Arm)
- Friction
- Mass

# Objective Function

## Optimized Parameters:

- Inertia (Engine)
- Inertia (Arm)
- Friction
- Mass

## Penalty Term:

$$\|\overline{X}_i - X_i(p)\|^2$$

# Objective Function

## Optimized Parameters:

- Inertia (Engine)
- Inertia (Arm)
- Friction
- Mass

## Penalty Term:

$$\frac{\|\bar{X}_i - X_i(p)\|^2}{\|\bar{X}_i\|^2}$$

# Objective Function

## Optimized Parameters:

- Inertia (Engine)
- Inertia (Arm)
- Friction
- Mass

## Penalty Term:

$$\frac{\|\bar{X}_i - X_i(p)\|^2}{\|\bar{X}_i\|^2} + \frac{\|\bar{Y}_i - Y_i(p)\|^2}{\|\bar{Y}_i\|^2}$$

$\bar{X}_i, \bar{Y}_i$  reference trajectories

# Objective Function

## Optimized Parameters:

- Inertia (Engine)
- Inertia (Arm)
- Friction
- Mass

## Penalty Term:

$$\frac{1}{n} \cdot \sum_{i=1}^n \left( \frac{\|\bar{X}_i - X_i(p)\|^2}{\|\bar{X}_i\|^2} + \frac{\|\bar{Y}_i - Y_i(p)\|^2}{\|\bar{Y}_i\|^2} \right)$$

$\bar{X}_i, \bar{Y}_i$  reference trajectories

# Objective Function

## Optimized Parameters:

- Inertia (Engine)
- Inertia (Arm)
- Friction
- Mass

## Penalty Term:

$$\min_{p \in \mathbb{R}^4} f(p) = \frac{1}{n} \cdot \sum_{i=1}^n \left( \frac{\|\bar{X}_i - X_i(p)\|^2}{\|\bar{X}_i\|^2} + \frac{\|\bar{Y}_i - Y_i(p)\|^2}{\|\bar{Y}_i\|^2} \right)$$

s. t.  $p_j \geq 0$

$\bar{X}_i, \bar{Y}_i$  reference trajectories

# Influence of the Parameters

10% parameter deviation:

- Inertia (Engine):  $1 \cdot 10^{-3}$
- Inertia (Arm):  $3 \cdot 10^{-3}$
- Friction:  $8 \cdot 10^{-11}$
- Mass:  $5 \cdot 10^{-2}$

# Influence of the Parameters

10% parameter deviation:

- Inertia (Engine):  $1 \cdot 10^{-3}$
- Inertia (Arm):  $3 \cdot 10^{-3}$
- Friction:  $8 \cdot 10^{-11}$
- Mass:  $5 \cdot 10^{-2}$

Big parameter changes  $\Rightarrow$  Small effects

# Influence of the Parameters

10% parameter deviation:

- Inertia (Engine):  $1 \cdot 10^{-3}$
- Inertia (Arm):  $3 \cdot 10^{-3}$
- Friction:  $8 \cdot 10^{-11}$
- Mass:  $5 \cdot 10^{-2}$

Big parameter changes  $\Rightarrow$  Small effects

# Optimizers
